

GACHŌ BADI (GOOSE BUDDY) — DRAFT #9

GDD Draft #9 · Reviewed 2026-07-30 · Draft #9 claims to close all 12 BLOCKING findings from Draft #8

Closer to production-ready than Draft #8, but not there yet. The two new BLOCKING findings this round are not new problems — they are the same completion-gate failure mode surfacing at a different checkpoint, plus a second timing bug that can silently undo the very fix the document is proudest of.

2

BLOCKING

down from 12 in Draft #8

2

UNRESOLVED DISAGREEMENTS

TOP 5 ISSUES

01

BLOCKING STRENGTHENED

The "true ending" completion condition may be mathematically unreachable — the same bug Draft #9 fixed for the pacing gate, now at the final gate.

Retirement and resolution are explicitly two different outcomes, but only "resolved" counts toward the true ending, and retirement is a

one-way door with no path back. Adversarial QA named this as the identical failure mode Draft #9 claims to have closed for the 75% pacing gate — just relocated to the completion gate instead.

BUSINESS ANALYST

02

BLOCKING

STRENGTHENED

The async pre-generation fallback can let a task resolve and permanently retire before its mandatory authored backstory ever displays.

The goal-state completion check is content-independent and can be satisfied by the generic placeholder reaction alone. Since resolution is a one-way door, the mandatory "authored why" guarantee this draft was written to add can silently never fire for that task, for any playthrough.

PLAYER PSYCHOLOGIST

03

MAJOR

STRENGTHENED

The "rising complexity" pacing claim is asserted but structurally undermined by the game's own mechanics.

The goose's verb set is frozen for the whole game; the Relationship Agent's data model is pairwise while later tasks need multi-resident premises with no composition mechanism; and relationship material is consumed one-way, so the richest content is spent earliest. Four reviewers converged independently on this one unsupported claim.

NARRATIVE CRITIC

FEASIBILITY LEAD

04

MAJOR

STRENGTHENED

The "harmony" ending has no narrative content, and the post-completion experience is undefined.

"Game Completion" reduces the entire emotional throughline to a state check, with no final scene or cast acknowledgment. Business Analyst added that the document never says whether a player can still inhabit the island after harmony is declared, or whether the game simply stops being playable.

BUSINESS ANALYST

05

MAJOR

STRENGTHENED

No schedule discipline for Weeks 4-12, and it's unresolved whether the task catalog is runtime-generated or pre-authored.

The effort ratio between the 3-week slice and the remaining 9 weeks is unjustified with no stated basis for what gets faster, and the architecture has only grown across nine drafts with no descoping contingency if the schedule slips.

FEASIBILITY LEAD

BUSINESS ANALYST

Notable runner-up, named by two reviewers as one convergent problem: Gachō Badi's identity is defined almost entirely by subtraction from its two reference games (not UGG's chaos, not Tomodachi Life's open-endedness) without positive characterization of its own — spanning the goose's absent motivation, the "quiet community-builder" tag contradicted by

authored loud solutions, and an audience positioning that oversells the Tomodachi Life crossover.

THE DISAGREEMENT

Is the runtime/dev-time content-generation split load-bearing, or decorative overhead?

BUSINESS ANALYST The split may buy nothing — the roster is fixed, the catalog is bounded, and content pre-generates before the player can attempt it. The entire rate-limit/async engineering apparatus exists only because of a framing choice, not a design requirement.	ADVERSARIAL QA Directly disputes this: the fallback is not invisible, it's a strictly worse placeholder that can permanently lock out the authored backstory once a task retires (Issue #2) — proof the split is currently load-bearing, dangerously so.
--	--

Feasibility Lead offered a middle position — resolve this per-agent, since some outputs are genuinely a function of player-specific history and others are safely dev-time-bakeable — but the board did not converge on which framing should govern the fix.

Does fixing the true-ending reachability bug risk making the narrative problem worse?

ADVERSARIAL QA Frames Issue #1 as a completion-logic defect inviting a state-machine fix — e.g., let retired tasks count toward "resolved" too.	NARRATIVE CRITIC Warns against exactly that fix: a resident whose task retired outright never actually got their arc told, so accepting "retired" as "resolved"
---	---

would let the game declare everyone connected over cast members whose reconciliation never happened — solving the math while hollowing out the ending further.

Narrative Critic argues any fix needs a narrative answer (a replacement task, or ending text acknowledging unresolved threads), not just a flag adjustment. The board did not resolve which kind of fix Issue #1 requires.

ROUND 1 FINDINGS

MAJOR

"Rising complexity" is asserted, not mechanically demonstrated

The goose's toolkit never changes across the game; nothing shows a later task's solution path is actually harder to execute than an early one.

MAJOR

Relationship data model is pairwise, but later complexity requires n-ary composition

No mechanism describes how the Task Creator combines multiple pairwise records into one coherent multi-resident premise, or resolves conflicting states.

MAJOR**The relationship-material reservoir shrinks in the wrong direction**

Relationship states never decay and are consumed one-way, so the richest dramatizable material is spent earliest — exactly when the design needs deeper material for later sets.

MINOR**Tutorial tasks aren't clearly placed inside or outside the 30-40-task accounting**

Unclear whether tutorial tasks count toward the lifetime total and the 75%-gate math.

ROUND 2 — CROSS-EXAMINATION**CONNECTIONS**

Feasibility Lead's build-cost framing of the frozen verb set independently reaches the same fracture point as the rising-complexity finding. Adversarial QA's stale-premise bug turns the pairwise-vs-n-ary composition gap from a spec question into a demonstrated concrete bug.

The reservoir-shrinkage finding plausibly feeds Adversarial QA's blocking true-ending-unreachable finding, by supplying a mechanism for why unsolvable-task retirement should become more likely late-game.

CONFLICTS

Pushed back on Feasibility Lead's framing that the generation-vs-authoring ambiguity is orthogonal to the reservoir-shrinkage finding — the runtime regime the document actually describes is the more fragile one, since nothing reserves rich material for later sets.

REVISIONS

Upgraded confidence (not severity) on the rising-complexity finding given four-reviewer convergence, and upgraded the pairwise-composition finding from spec-gap to demonstrated bug per Adversarial QA's concrete example.
